B

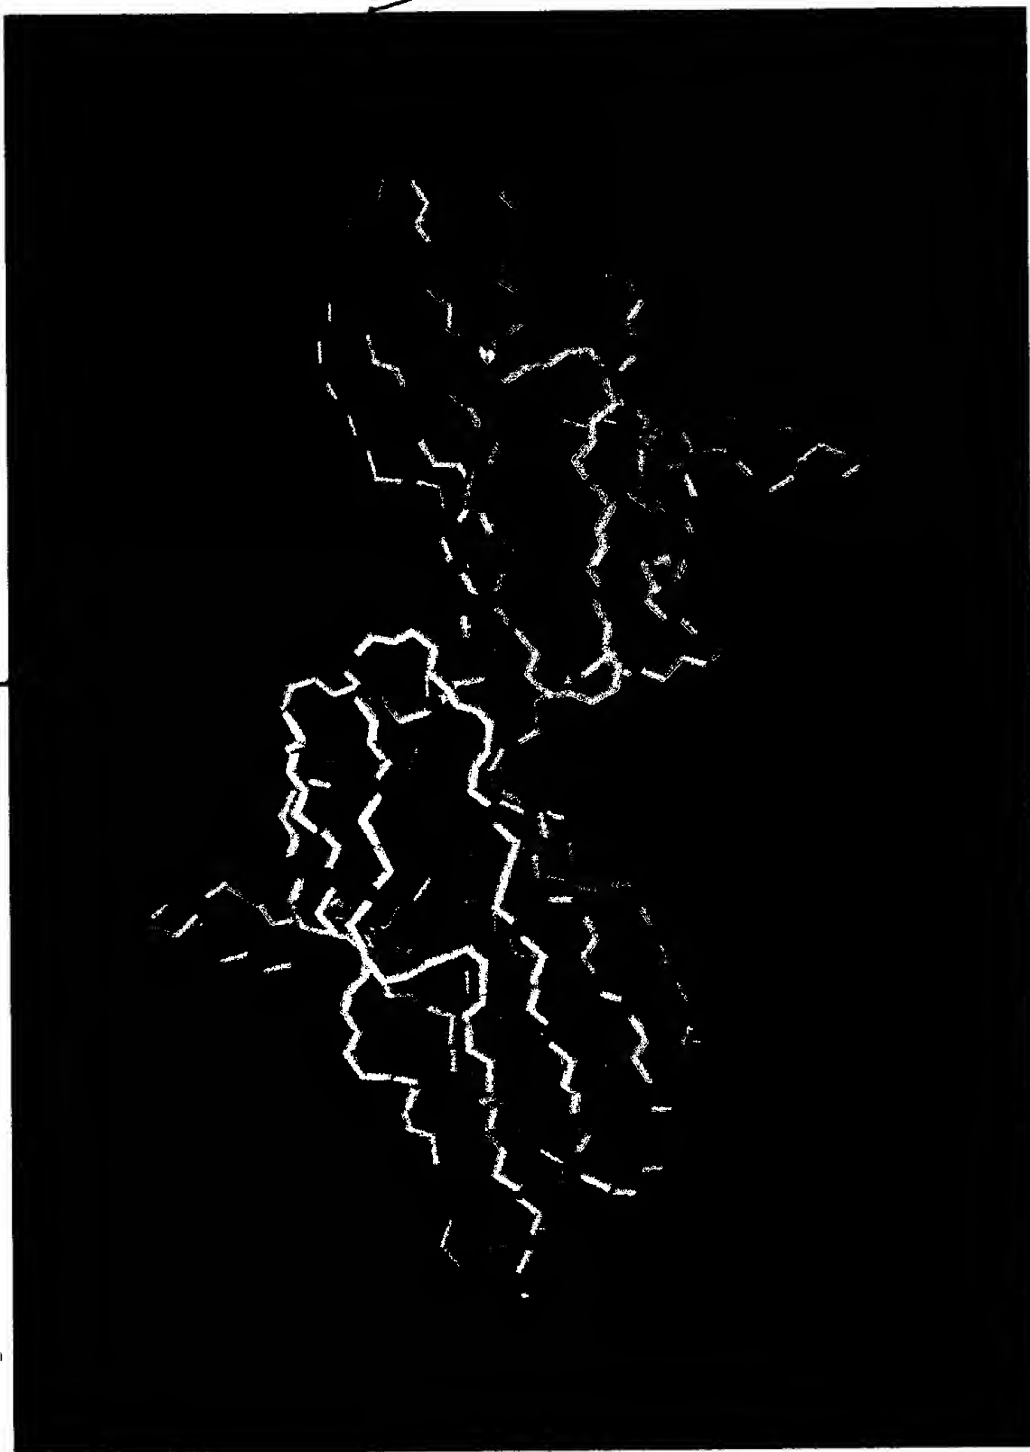

FIG 1

FIG. 1 shows a cross-section of a material having a complex, irregular, and jagged internal structure, which may be a result of a process such as etching or corrosion. The structure is characterized by a central, somewhat symmetrical, and highly irregular shape, with many sharp, pointed edges and a highly textured surface. The overall appearance is that of a highly porous or highly irregular material, possibly a biological or geological specimen, or a material that has been subjected to a highly corrosive or etching process.
